EvaluationofSynergisticEffectsof4OMethylDglucosamin

Lilian Amrein, May Shawi, Jeremy Grenier, Raquel Aloyz, and Lawrence Panasci

Unicancer

Figure 5. Relative effects of 4-O-Methyl-D-glucosamine, thesterone, and theostatin on cells in lung. (A) Lung cells were obtained from a representative sample of 1485 patients. (B) Lung cells were obtained from a representative sample of 1485 patients. (C) Lung cells were obtained from a representative sample of 1485 patients. (D) Lung cells were obtained from a representative sample of 1485 patients. (E) Lung cells were obtained from a representative sample of 1485 patients. (F) Lung cells were obtained from a representative sample of 1485 patients. Total RNA is extracted from the tissues of the lung. (A) Sections of all bronchial sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (B) Sections of the left and right breast sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (C) Sections of the right breast section were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (D) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. Total RNA is extracted from the tissues of the lungs. (A) Sections of the left and right breast sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (B) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (C) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. Total RNA is extracted from the tissues of the lungs. (B) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (C) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (D) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. Total RNA is extracted from the tissues of the lungs. (A) Sections of the left and right breast sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min. (B) Sections of the left and right lung sections were dissected by a hypo-epithelium-coated needle at a speed of 1,000 mm/min.
