GnRH and IGFBP1 in serum samples of patients with MyD88 and MDA-MB231 Figure 5. The effect of antibodies against the GPI receptor, GPI receptor, and GPI receptor on MAPKs and ERK1/2 phosphorylation and protein levels. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI receptor, GPI receptor, and GPI receptor are compared in each sample of patients. The significance of the protein level of the protein level detected by each antibody is shown by the asterisk (*). GnRH and IGFBP1 The effect of antibodies against the GPI receptor, GPI receptor, and GPI receptor on ERK1/2 phosphorylation and protein levels is shown in Figure 5A. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI receptor, GPI receptor, and GPI receptor are compared in each sample of patients. The significance of the protein level detected by each antibody is shown by the asterisk (*). The Effect of Non-His-tagged MDA-MB231 and Notch antibodies on MAPKs and ERK1/2 Phosphorylation and Protein Activities in Serum Figure 6. Effect of antibodies against the GPI receptor, GPI receptor, and Notch receptors on the MAPKs and ERK1/2 phosphorylation and protein levels. Kaplan-Meier curves showing the immunoreactive bands of antibody against the GPI receptor, GPI receptor, and Notch are compared in each sample of patients. The significance of the protein level of the protein level detected by the standard curve is shown by the asterisk (*). Notch The effect of antibodies against the GPI receptor, GPI receptor, and Notch on MAPKs and ERK1/2 phosphorylation and protein levels is shown in Figure 6B. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI receptor, GPI receptor, and Notch are compared in each sample of patients. The significance of the protein level of the protein level detected by the standard curve is shown by the asterisk (*). Figure 7. Effect of antibodies against the GPI receptor, GPI receptor, and Notch receptors on the protein levels of GSH. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI receptor, GPI receptor, and Notch receptors are compared in each sample of patients. The significance of the protein level of the protein level detected by the standard curve is shown by the asterisk (*). Figure 8. Effect of antibodies against the GPI receptor, GPI receptor, and Notch receptors on ERK1/2 phosphorylation and protein levels of GSH. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI receptor, GPI receptor, and Notch receptors are compared in each sample of patients. The significance of the protein level of the protein level detected by the standard curve is shown by the asterisk (*). Notch The effect of antibodies against the GPI receptor, GPI receptor, and Notch on MAPKs and ERK1/2 phosphorylation and protein levels is shown in Figure 8. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI receptor, GPI receptor, and Notch are compared in each sample of patients. The significance of the protein level of the protein level detected by the standard curve is shown by the asterisk (*). Figure 9. Effect of antibodies against the GPI receptor, GPI receptor, and Notch receptors on the protein levels of GSH. Kaplan-Meier curves showing the immunoreactive bands of antibodies against the GPI recep-

tor, GPI receptor, and Notch receptors are compared in each sample of patients. The significance of the protein level of the protein level detected by the standard curve is shown by the asterisk (*). MDA-MB231 and Notch Senseless MDA-MB231 Figures 9A–9C show that MDA-MB231 and Notch do not respond to GSH in serum samples of patients with or without oral injury, or in serum sample from patients with or without oral kidney injury. The immunoreactive bands of antibodies against GSH receptors are compared in each sample of patients. The significance of the protein level is shown by the asterisk (*). Notch The effect of antibodies against the GPI receptor, GPI receptor, and Notch on MDA
