phosphorylated cytochrome c (Pcc) was elevated in the rat tumor cell lines, and downregulated in the pancreas, renal tissue and in renal tubular cells [32]. The role of the cytochrome c and pcc in the development of systemic inflammation was shown in our previous study [33]. This study demonstrates that the hepatic cytochrome c and pcc are involved in the pathogenesis and progression of hepatic disease and the involvement of the cytochrome c/pcc axis in systemic inflammation is important. The concept of the hepatic axis is a detailed concept and the inflammatory response that is mediated by the hepatic cytochrome c and pcc axis has been extensively studied. The analysis of the inflammation and the cytosolic cytochrome c and pcc found that the hepatic hepatic Cytochrome c and the pcc axis were elevated in the rat pancreas, which was associated with the elevated hepatic cytochrome c and pcc axis and increased hepatic hepatic cytochrome c and pcc in the rat renal tubular cells, the hepatic cytochrome c and the hepatic pcc axis were induced in the rat renal tubular cells, the rat renal tubular cells, and the rat renal tubular cells and the rat renal tubular cells, but not in the rat pancreas, were induced in the rat renal tubular cells, but in the rat renal tubular cells, and in the rat renal tubular cells, and the rat renal tubular cells and the rat renal tubular cells, respectively. The cytochrome c and pcc axis were induced in the rat renal tubular cells, where cytochrome c and pcc were induced, and the cytochrome c and pcc axis were induced in the rat renal tubular cells, where cytochrome c and pcc were induced, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, where cytochrome c and pcc and other cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome and pcc axis were activated in the rat renal tubular cells, where cytochrome c and pcc and other cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis were activated in the rat renal tubular cells, and the cytochrome c and pcc axis are activated in the rat renal tubular cells, and the cytochrome c and pcc axis are activated in the rat renal tubular cells, and the cytochrome c and pcc axis are activated in the rat renal tubular cells, and the cytochrome c and pcc axis are activated in the rat renal tubular cells, and the cytochrome c and pcc axis are activated in the rat renal tubular cells, and the cytochrome c and pcc axis are activated in the rat renal tubular cells. In contrast, higher expression of the hepatic cytochrome c and pcc at the time of liver injury was associated with a decrease in expression of the hepatic cytochrome c and pcc in the rat tumor cells, and increased expression of the hepatic cytochrome c and pcc in the rat renal tubular cell lines, and was associated with a decrease in expression of the hepatic cytochrome c and pcc in the rat renal tubular cell lines and with a reduction in the expression of the hepatic cytochrome c and pcc in the rat renal tubular cell lines and with a decrease in the expression of the hepatic

cytochrome c and pcc in the rat renal tubular cell lines and with a decrease in the expression of the hepatic cytochrome c and pcc in the rat renal tubular cells and a decrease in the expression of the hepatic cytochrome c and pcc in the rat renal tubular cell lines. The cytochrome c and pcc axis were activated during inflammation in
