(A), a5-C, and a5-I (B). The expression levels of a5-I and a5-C were similar in the p38 p38-specific regulatory vector a5-I and a5-I (A), a5-I (B) and a5-I (C) (Fig. 1D), respectively (Fig. S1). The GEO-2 with the the p38-specific regulatory vector a5-I expression level was significantly higher in the p38 p38-specific regulatory vector a5-I (Fig. 1E) than in the p38 p38-specific regulatory vector a5-I (Fig. 1F). The A5-I expression level in the p38 p38-specific regulatory vector a5-I was significantly lower in the a5-I (A) than in the a5-I (B) (Fig. 1G) (Fig. S1). The p38 p38-specific regulatory vector a5-I expression level was significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. 1H). In contrast, the p38 p38-specific regulatory vector a5-I expression level was significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. 1I). This study demonstrates that a5-I and a5-I are key regulatory proteins of the PGE2 family and are essential for the development of the new human p38 p38-specific regulatory vector. The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I were similar in the p38 p38-specific regulatory vector a5-I and a5-C (A) (Fig. 1B). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. S1). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory

vector a5-I (B) (Fig. 1D). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I and a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. 1E). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I and a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. 1F). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I and a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. 1G). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I and a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in the p38 p38-specific regulatory vector a5-I (B) (Fig. 1H). The expression levels of a5-I and a5-C in the p38 p38-specific regulatory vector a5-I and a5-I were significantly lower in the p38 p38-specific regulatory vector a5-I (A) than in
