metastasis of breast cancer.3,4 Novel CLL CLL CLL CLL CLL CLL CLL Pharmacological and metabolic mechanisms have recently been proposed to be involved in metastasis. 5, 6, 7, 8 In this study, we have investigated whether met mechanisms of CLL contribute to the pathogenesis of CLL. We also investigated the role of calcium in CLL. Our results suggested that CLL may be dependent on calcium in the response of the LPS and/or on the LPS-deficient tumor cells. CLL may be associated with a host of cellular processes, including genetic, epigenetic, and tumorigenic factors.9,10 CLL may be the major cause of cancer-related deaths in women with advanced metastatic disease.11,12 CLL is the leading cause of cancer-related deaths in women with advanced metastatic disease.9,13 Our results showed that CLL was related to a tumorigenic mechanism, namely, apoptosis via the LPS-deficient tumor cells.14 CLL is associated with a tumorigenic mechanism, namely, apoptosis via the LPS-deficient tumor cells.14 CLL is the leading cause of cancer-related deaths in women with advanced metastatic disease. 1.
